

This PDF is *double-width*: the slide occupies the left half of every page, the speaker notes the right half.

Welcome! This is the notes half — only you see it. The audience window receives a cropped slide-only copy of this same PDF. Turn pages with the arrow keys or the buttons; the timer starts on your first page turn (reset it with the button next to it). Drag the separators to resize the three panes; double-click a separator to reset.

Animated pgfplots: policy training

This is a pgfplots chart animated with the animate package: the two training curves are progressively revealed, like watching a run progress. The motion is kept fluid by baking opacity ramps into the frames (the animate package has no built-in frame transitions): the data fades in at the start of each loop, fades out at the end — so the loop wraps without a hard cut — and a dot rides each curve's frontier. The audience deck is derived with pdf-lib CropBox surgery, which keeps the widget annotations — so the animation still plays in the audience window (official pdf.js viewer).

Pick your own deck

Use **Browse PDF...** to open your own double-width build — for example beamer's `show notes on second screen=right`.

Slides without a `\note{}` show an empty right half in the console — that is content, not a bug. The next-slide pane on the far right previews what comes next.
